RUBELLA IGM /IGG RAPID TEST

DIFFERENTIATING ACUTE INFECTION FROM PAST IMMUNITY

Generally rubella is considered a mild adolescence disease. However a maternal infection could be transmitted through the placenta to the fetus, causing congenital rubella. Primary rubella infection contracted during early pregnancy, may have severe consequences as severe fetal damage, stillbirth or abortion. Children born asymptomatic may develop these abnormalities later in life. Widespread vaccination has significantly reduced the incidence of rubella in all age groups. However, 10 to 20% of young adults still appear susceptible to the virus. To reduce risk of severe complications, accurate serological methods must be performed to determine the serologic status of childbearing aged women.

Ordering Information

Cat. No.: SIC-RDT-RUB-202059

Product: Rubella IgG/IgM Rapid Test

Specimen: Whole Blood/Serum/Plasma

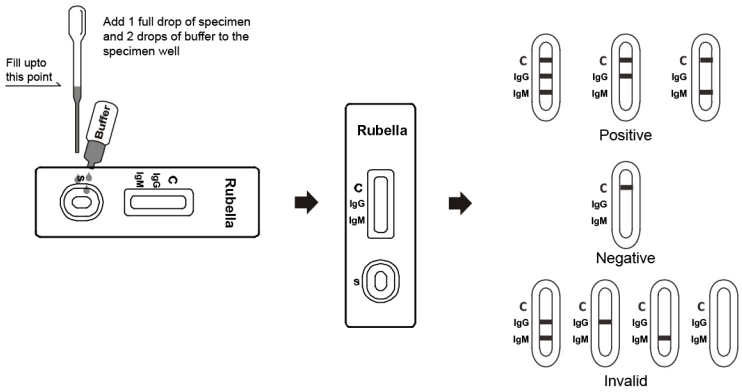

Format: Cassette

Kit Size: 25 T

Product Advantages

- ✓ Fast results in **15** minutes
- ✓ Easy visual interpretation
- ✓ High accuracy

Convenient Procedure

Sicuro Bioengineering Ltd.
Address: 19 East West Road, Port Harcourt - Nigeria
