

SYPHILIS RAPID TEST

RELIABLE SCREENING FOR SYPHILIS ANTIBODIES WITH HIGH SENSITIVITY

According to the Center for Disease Control (CDC), the number of cases of Syphilis infection has markedly increased since 1985. Some key factors that have contributed to this rise include the crack cocaine epidemic and the high incidence of prostitution among drug users. One study reported a substantial epidemiological correlation between the acquisition and transmission of the HIV virus and Syphilis. Multiple clinical stages and long periods of latent, asymptomatic infection are characteristic of Syphilis. Primary Syphilis is defined by the presence of a chancre at the site of inoculation. The antibodies response to the TP bacterium can be detected within 4 to 7 days after the chancre appears. The infection remains detectable until the patient receives adequate treatment.

Ordering Information

Cat. No.: SIC-RDT-TP-202023

Product: Syphilis Rapid Test

Specimen: WB/S/P

Format: Dipstick

Kit Size: 50 T

Product Advantages

- ✓ Fast results in **5** minutes
- ✓ Easy visual interpretation
- ✓ High accuracy

Convenient Procedure
